SITUATION SUMMARY

California Department of Public Health Zika Virus Disease Update

The Medical and Health Coordination Center (MHCC) continues to be activated in response to the Zika virus disease (Zika) in order to aggregate and update information from a variety of sources and coordinate response activities across the California Department of Public Health (CDPH).

- CDPH centers and programs are providing information related to their specific activities on a weekly basis. This information is being collected and included in a weekly Public Health and Medical Emergency Function (EF) 08 Situation Report released by the MHCC. The MHCC is managing requests for information from the public, healthcare facilities, and Local Health Departments (LHDs) to ensure responses are timely and accurate.
- Zika is transmitted to people primarily through the bite of an infected *Aedes aegypti* mosquito (also known as yellow fever mosquitoes) and *Aedes albopictus* mosquito (also known as Asian tiger mosquitoes), which are not native to California. Today, 54 countries have documented Zika virus transmission, with over 40 reporting their first outbreak within recent months. The most common symptoms of Zika virus are fever, rash, joint pain, and conjunctivitis (red eyes). People do not consistently get sick enough to seek treatment at a hospital, and the mortality rate for Zika is extremely low. For this reason, many people might not realize they have been infected. However, Zika virus infection during pregnancy can cause a serious birth defect called microcephaly, a condition where a baby's head is much smaller than normal, as well as other severe fetal brain defects.
- The Centers for Disease Control and Prevention (CDC), CDPH, Emergency Medical Services Authority (EMSA), California Governor's Office of Emergency Services (Cal OES), and State level EF 08 partners are preparing for the management of Zika cases in California. Reporting of select notifiable diseases is mandated by State law in California through Title 17 California Code of Regulations and Zika virus is now classified as a notifiable disease that must be reported. CDPH is working with the healthcare community and local health jurisdictions to identify potential suspect cases and avoid spreading of the disease. New and updated guidelines released by CDC are posted on the CDPH website available at: (<http://www.cdph.ca.gov/HealthInfo/discond/Pages/Zika.aspx>).
- CDC has established a national US Zika Pregnancy Registry to address questions about Zika-associated birth defects and other pregnancy outcomes. All data reported to the U.S. Zika Pregnancy Registry will be de-identified and healthcare provider participation is voluntary. CDPH is participating in the U.S. Zika Pregnancy Registry and is the point of contact for California data submission to CDC. CDPH is working with local health departments and healthcare providers to complete the U.S. Zika Pregnancy Registry data collection forms for submission to CDC.
- EMSA and the EMSA Duty Officer Program are monitoring the situation and remain in communication with the Regional Disaster Medical and Health Coordination (RDMHC) and Medical Health Operational Area Coordination (MHOAC) Programs throughout California.
- Please see attached for full report.

WEATHER SYNOPSIS BY REGION

NORTHERN CALIFORNIA

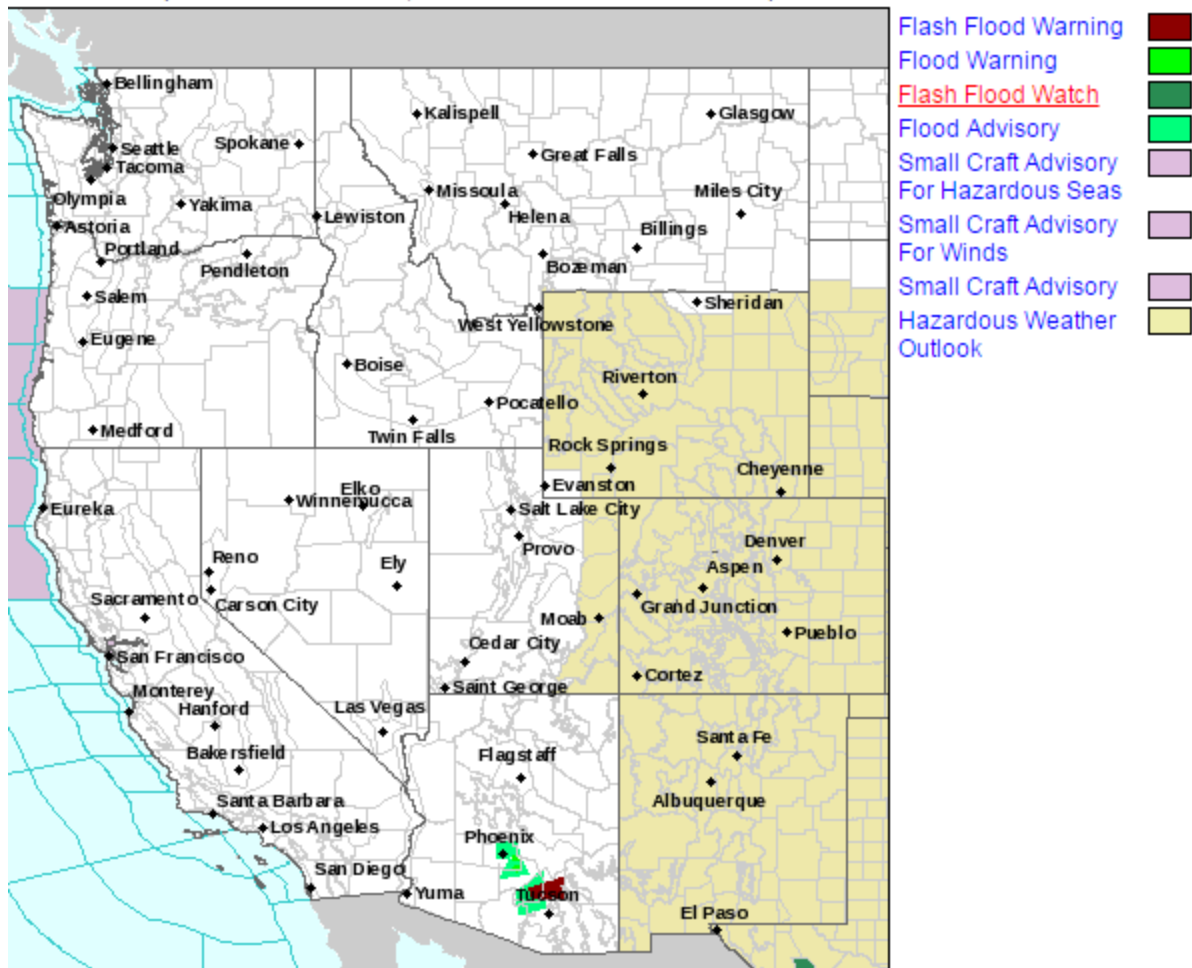

A high pressure ridge over the region will strengthen through Friday, then slowly move off to the east on Saturday. Inland areas will be about the same each day through Saturday, with afternoon high temperatures around 5-8 degrees above seasonal normals and minimum afternoon relative (RH) around 7-15%. Mid and upper slopes will see RH recover to only 20-35% each night. The marine layer will become more shallow and only affect areas near the immediate coast through Friday with a moderate afternoon sea breeze in coastal areas and through the straits and delta. The marine layer will begin to deepen and move farther inland with stronger sea breeze winds late Saturday. On Sunday a fairly weak Pacific trough is expected to reach the north coast. Temperatures will cool back to near normal or just slightly above normal through much of next week as the weak trough remains overhead. Humidity in inland areas will remain low, both at night and during the day. There is only a remote chance of showers or thunderstorms on Sunday in far northwestern areas. By Wednesday southerly flow on the east side of the trough may pull enough monsoon moisture northward to produce isolated thunderstorms in the eastern portion of the region. Current computer models show this thunderstorm potential continuing through the following weekend.

SOUTHERN CALIFORNIA

High pressure over the Pacific Ocean will approach the West Coast bringing near normal temperatures today, with upper 70s and 80s across the mountains and upper 80s and 90s in the valleys. The high pressure area will move overhead Friday and then it will be just to the east of the region Saturday through early next week causing temperatures to become above normal. Widespread triple digit heat will occur across the valleys and foothills Saturday through early next week. Minimum humidity will be mainly in the single digits and teens above and away the marine layer through early next week. The marine layer is currently around 2,000 feet deep, but will become shallower by the weekend as high pressure strengthens. Isolated showers and thunderstorms will occur along the Colorado River through Friday afternoon; otherwise it will be dry through early next week. A weak area of low pressure will form off the California Coast bringing significant cooling and an increase in humidity to the region starting Wednesday. This low may also bring a chance of showers and thunderstorms to the mountains and deserts by the middle or end of next week.
